Biochem. Biophye. Res. Commun. 211:586-589(1995).

--- FUNCTION: May catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the PI position. SCCE cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

-i- TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Also expressed in the brain, mammary gland, cerebellum, spinal cord and kidney. Lower levels in salivary glands, uterus, thymus, thyroid, placenta, trachea and testis. Up-regulated in ovarian carcinoma, cespecially late-stage serous carcinoma, compared with normal ovaries and benign adenomas (at the protein level).
                                                                                                                                                                                                                                                      -!- INDUCTION: By estrogens and glucocorticoids in a breast carcinoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -I- PTM: Proteolytic processing yields a number of bioactive forms, consisting either solely of the mature alpha chain, of the most N-terminal propeptide linked through a disulfide bond to the mature alpha chain, or of the entire proprotein.
-I- SIMILARITY: Belongs to the TGF-beta family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       J. Mol. Endocrinol. 21:141-152(1998).

-1- FUNCTION: Inhibins and activins inhibit and activate, respectively, the secretion of follitropin by the pituitary gland. Inhibins/activins are involved in regulating a number of diverse functions such as hypothalamic and pituitary hormone secretion, gonadal hormone secretion, germ cell development and maturation, erythroid differentiation, insulin secretion, nerve cell survival,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NCLEOTIDE SEQUENCE.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Fatent No. US20020142317A1

GENERAL INFORMATION:

APPLICANT: Cannon, Martin J.

APPLICANT: Cannon, Martin J.

APPLICANT: Cannon, Methods for the early diagnosis of ovarian cancer;

TILLE OF INVENTION: Methods for the early diagnosis of ovarian cancer;

FILE REFERENCE: D6223CIP/C/D/CIP

CURRENT APPLICATION NUMBER: US/09/918,243

CURRENT APPLICATION NUMBER: US

PRIOR APPLICATION NUMBER: US

PRIOR FILING DATE: 2001-07-30

PRIOR FILING DATE: 2001-07-13

NUMBER OF SEQ ID NOS: 136

SEQ ID NO 33

LENGTH: 9

Diagnosing cancer comprises detecting stratum corneum chymotrypsin enzyme.

Claim 25; Page 103; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or pancreatic cancer, and other cancers in which SCCE is overexpressed. The peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                     Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:34.

                The present invention describes NOVX proteins, where X can be 1 to 55 cd eac. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) at the composition described above; (3) an isolated nucleic acid described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cellally comprising the nucleic acid molecule described above; (5) a cellally brinds to the polypeptide described above; (5) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above; (10) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for a pathology associated with the polypeptide; (11) a method of careening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (11) a method for modulation or preventing a pathology associated with the above polypeptide; (12) a method for mammal; and (14) a method for producing the above polypeptide in a correspondent and (14) a method for producing the above polypeptide in a manulation and (14) a method for producing the above polypeptide or preventing a pathology associated with the above polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic avid molecule may be used to diagnose, treat or prevent metabolic activities, and can be used in gene therapy. The card molecule may be used to diagnose, treat or prevent metabolic dyshipidaemias. The nucleic acids can also be used as hybridisation and present sequence a pathore and substances and as diabetes or obesity, infections, cancer, or prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; NOVX; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyelipidaemia; metabolic syndrome X;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated NoVX polypeptides and polymucleotides.

NoVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abberrant expression and activity of NoVX polypeptides. For example, NoVX polypeptides and condition in human related to the abberrant expression and activity of NoVX polypeptides and conversely, antisense NA molecules may be administered to down regulate expression of NoVX polypeptides by binding with the cells own genes and preventing their expression. NoVX bolymeticotides and complementary sequences may also be used as DNA probbe in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NoVX polypeptides may also be used as untigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NoVX. The trie production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NoVX.

Toplypeptides. The anti-NoVX polypeptide antibodies may also be used as anti-NoVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NoVX in samples. NoVX polypeptides antibodies may be used in this way to prevent, diagnose and treat: metabolic disorders, immune disorders, disorders, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, and the various dyslipidaemias, metabolic and substances associated with obesity, the metabolic syndrome X and the various dyslipidaemias, metabolic man and the various dyslipidaemia, metabolic man and the various dyslipidaemias, metabolic man and the various dyslipidaemias, metabolic man and the various dys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromesome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food polypeptide in tissue, as molecular weight markers and as a food polypeptide in tissue, as molecular weight markers and as a food polypeptide and polymucleotide sequences have applications in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The colypeptide and polymucleotide sequences have applications of mutations diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and produce other types of data and produce of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human, NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antibatkinsonian; antilipaemic; gene therapy; human disease; metabolic disorder; diabeter; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ő

Claim 1; Page 171; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide

coestibled above and a carrier; (2) a kit comprising in one or more

containers, the composition described above; (3) an isolated nucleic acid

containers the muclic acid molecule described above; (5) a cell

comprising the nucleic acid molecule described above; (5) a cell

comprising the above vector; (6) an antibody that immunospecifically

binds to the polypeptide described above; (7) methods for determining the

comprising the above vector; (6) an antibody that immunospecifically

comprising the above vector; (6) an antibody that immunospecifically

comprising the above vector; (6) an antibody that immunospecifically

comprising the above vector; (6) an antibody that immunospecifically

comprising the above vector; (6) an antibody that immunospecifically

comprising the above polypeptide or nucleic acid molecule in a

disease associated with altered lavels of expression of the above

comprising to a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for a bearrant physiological interactions of the polypeptide; (11) a method of

compression of activity or of latency or predisposition to a pathology associated with the above polypeptide. Novx

commanal; and (14) a method for producing the above polypeptide. Novx

commanal; and (14) a method for producing the above polypeptide. Novx

commanal; and (14) a method for producing the above polypeptide or the nucleic and antilipaemic activities, and crapic antiparterial, viruciae, and converse or immunomodulator, cycostatic, and crapic and properties and antilipaemic activities, and crapic and properties or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic

control molecule may be used to observe treater prevent metabolic. neurodegenerative disorders such as Alzheimer's disease or Parkinson's

```

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and continuous control or activity of NOVX by supplementing the patient our control or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX polypeptide and complementary sequences may also be used as DNA probabe in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as diagnose and treat: metabolic disorders, diaberes, obesity, infectious disorders, anorexia, cancer, cancer-associated cancexia, neurodegenerative disorders, and the various dyslipidaemias, metabolic disorders, haematopoletic disorders, parkinson's bisorder, immune disorders, and the various dyslipidaemias, metabolic distracts, the metabolic syndrome X and Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;

```
The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comportising; in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a forest method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for method of identifying a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of serening for a modulator of activity or of latency or presipposition to a pathology associated with the polypeptide; (12) a method of mammal; and (14) a method for producing the above polypeptide in a pathology associated with the above polypeptide; (10) a method of producing the above polypeptide in a method of producing the above polypeptide or the aniquator, cytostatic, anotropic, anitheresing and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a method or provent metabolic and antilipaemic activities, and can be used in gene therapy. The collegenerative disorders such as Aliabeimer's disease or Parkinson's disease such as diabetes or obesity, infections, cancering and collegenerative disorders such as Aliabeimer's and vale arious and disperse or obesity in farmance and an inventive metabolic acide can also be used as hybridisation and probes, in chromosome mapping, issue typing, preventive metabolic and probes, in chromosome

                                                                                                                                                                                        10-APR-2003
                                                                                                                                                                                                                                                                                                                    05-OCT-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              29-MAY-2002
    The invention relates to isolated NOVX polypeptides and polynucleotides. NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polynucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (agonists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polymcleotide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX diagnose and treat: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer, associated cachexia, neurodegenerative diagnosers. Alzhaimer's Disease, Parkinson's Disorder, immune disorders, haematopoietic disorders and the various dyslipidaemias, metabolic disorders, the metabolic syndrome X and disturbances associated with obesity, the metabolic syndrome X and
                                                                                                                                                                                                              Dipippo VA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                                                                                         Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X; Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E; Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shinkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo Eisen A, Gangolli EA, Rieger DK, Spaderna SK;

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOVI). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule above; (8) methods for determining the parample; (8) methods for determining the presence of or predisposition to

```
c a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of acreving for a medulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide above; (13) methods of treating or preventing a pathology associated with the above polypeptide. Now sequences have antidiabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a pathology associated with a buman disease. The polypeptide or the nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated NOVX polypeptides and polynucleotides. NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; SEQ ID NO 104; 395pp; English.

production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOWX polypeptides by binding with the cells own genes and preventing their expression. NOVX polynuclectides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and anteaponists) of the expression and activity of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polypeptide antibodies and antibodies and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polynucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, and the various dyslipidamias, metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                           New isolated polypeptides, useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            gene 15
                                                                                                                                                                                                                                     The invention relates to PS133 protein, a member of the human serine protease family and its corresponding nucleic acid sequence. PS133 polypeptide is useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating or determining predisposition to diseases or conditions of the prostate such as prostatic cancer. The present sequence is the human stratum corneum chymotrypsin protein. This sequence is used to align with PS133 consensus protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel extracellular serine protease, termed tumor antigen-derived gene protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human Stratum Corneum Chymotryptic Enzyme, SCCE, catalytic domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell
comprising the nucleic acid molecule described above; (6) a cell
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with alered levels of expression of the above
CC adisease associated with alered levels of expression of the above
CC above; (10) a method for identifying a potential therapeutic agent for
custod identifying an agent that binds to the polypeptide described
cc above; (10) a method for identifying a potential therapeutic agent for
custod identifying a pathology that is related to an aberrant expression or
aberrant physiological interactions of the polypeptide; (11) a method of
cor presenting for a modulator of activity or of latency or predisposition to
a pathology associated with the polypeptide; (12) a method for modulating
cc a pathology associated with the above polypeptide. NOVX
sequences have antidiabetic, anorectic, antibacterial, virucide,
cor preventing a pathology associated with the above polypeptide. NOVX
sequences have antidiabetic, nocropic, neuroprotective, antiparkinsonian
and antilipaemic activities, and can be used in gene therapy. The
colypeptide is useful in manufacturing a medicament for treating a
colypeptide is useful in manufacturing a medicament for treating a
colypeptide and as diabetes or obesity, infections, caechexia, cancer,
colypeptide andisorders, haematopolected disorders and various

```
The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or activity of NoVX polypeptides. For example, NoVX polypeptides and activity of NoVX polypeptides are associated with decreased activity of NoVX polypeptides. For example, NoVX polypeptides and polymucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our crecify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX polypeptides may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators the production of antibodies, agonists and activity of NOVX. The cused to modulate NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX colypeptides and polymolecities may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, hatheimer's bisease, parkinson's bisorder, immune disorders, hatmatopoietic disorders, and the various dyslipidaemias, metabolic mand and the particular matabolic syndrome X and the wasting disorders associated with obesity, the metabolic syndrome x and wasting disorders associated with obesity the metabolic syndrome sancers.
                                                                                                                                                                                                                                    Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;

N;Alternate names: chymotrypsin-like proteinase ANCHYM2
S;Species Anopheles gambiae (African malaria mosquito)
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 09-Jul-2004
C;Accession: S44184; S49130
S;Mueller, H.M.; Catternccia, F.; Crisanti, A.
Submitted the EMBL Data Library, April 1994
A;Bescription: An Anopheles gambiae locus containing the sequences of two closely relate
A;Reference number: S44184
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A;Cross-raferences: UNIPROT:Q17025; UNIPARC:UPI0000128657; EMBL:Z32645; NID:g474026; PID

C72166
A22R protein - variola minor virus (strain Garcia-1966)
C;Species: variola minor virus
C;Species: variola minor virus
C;Species: 24-Nov-1999 #sequence_revision 24-Nov-1999 #text_change 09-Jul-2004
C;Accession: C72166
R;Shchelkunov, S.N.; Totmenin, A.V.; Gutorov, V.V.; Safronov, P.F.; Massung, R.F.; Lopar submitted to GenBank, March 1998
A;Pescription: Analysis of the complete coding sequence of DNA of alastrim variola minor A;Reference number: A72150
A;Accession: C72166
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-426 cSHC>
A;Cross-references: UNIPROT:089166; UNIPARC:UPI0000061D50; GB:Y16780; NID:G5830555; PIDN
A;Experimental source: strain Garcia-1966
C;Genetics:
A;Gene: A22R
C;Superfamily: vaccinia virus probable 49.1K protein

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermia. Also expressed in the brain, mammary gland, crebellum, spinal cord and kidney. Lower levels in salivary gland, crebellum, spinal cord and kidney. Lower levels in salivary gland, crebellum, cpinal cord and kidney. Lower levels and testis. Up-regulated in ovarian carcinoma, especially late-stage serous carcinoma, compared with normal ovaries and benign adenomas (at the protein level).
INDUCTION: By estrogens and glucocorticoids in a breast carcinoma
